

Abstract

5 The invention is based on a hand-held power tool, in particular a sander, having a housing (10) and a motor (12) located in the housing (10), by way of which motor a driven shaft (16), extending from a face end (14) of the housing (10), is drivable, and having a suction conduit (18), extending at least partway through the housing (10).

10 It is proposed that the suction conduit (18) discharges at the face end (14).
